## What Is Ceramic Coating.

Ceramic coating is a liquid polymer solution that is applied over a product's paint through a chemical bonding process. Once the coating cures, it forms a protective layer that enhances gloss, repels water and dirt, and protects against UV rays, chemical stains, and environmental contaminants. When properly maintained, the coating can be effective for several years – substantially outlasting more traditional coating methods.

## Benefits of Ceramic Coating.

Up to **3X** more resistant to scratches than powder coating

Up to **2X** more of a thinner coating, to maintain product functionality

Up to **50%** more UV and water damage resistant than powder coating

Up to **3X** more resistance to corrosion and chemical damage

Over **200** colours to choose from for perfect colour matching

THE SUPERIOR COATING CHOICE  
FOR EXTERIOR APPLICATION

**TERRA.**

The Terra colour palette is designed exclusively for products intended to be installed outdoors. Protecting against UV rays, you can ensure the longevity of the chosen colour for your products. Additionally, ceramic coatings cause water to bead and roll off effortlessly, reducing the risk of water

spots and making cleaning significantly easier. With its ability to withstand harsh conditions and provide long-lasting protection, ceramic coating is the superior choice for preserving the appearance and increasing the aesthetic longevity of light fittings.
